

Curtains

- 1) Atmospheric/Sunlight degradation can cause the following:
 - a) Colour loss, especially on folds.
 - b) Weakening of fabric strength causing splitting of the material during necessary mechanical action.

- 2) Shrinkage
Relaxation shrinkage of between 3% and 5% is not uncommon with curtain material. This is due to the tensions in manufacturing being released in cleaning.
ie. 90" drop = 2.7" to 4.5"

- 3) Metal glitter found on certain curtains/household furnishings will often totally or partly be removed in cleaning.

I have read and understood the above and accept full responsibility for the items explained.
